MAR Systems Relocates to Solon, New Office Allows for Additional R&D

(SOLON, Ohio) Nov. 11, 2008 – MAR Systems LLC, relocated its offices from Mayfield Village to Solon as it moves toward commercializing its patented processes for removing arsenic, mercury and other heavy metals from water and industrial fluid waste streams.

“We were looking for a larger office and the ability to do lab and industrial work in an environment that supports relationships among commercial and industrial businesses. That is what supports the type of innovative research and development that MAR Systems is all about,” said Claude Kennard, chief executive officer, MAR Systems. “Our previous office did not have room for our company to grow and did not provide us an opportunity to conduct lab testing. This new office does and will help us finalize a market-ready water treatment product that establishes a new standard in effectiveness, cost and simplicity.”

By moving to Solon, MAR increased their office space from 1,300 to 4,000 square feet. MAR now operates in an expanded laboratory that allows for media research and development, water testing and a work area to assemble pilot units for clients to solve environmental problems faster, cheaper and greener than anything on the market. In addition to the newly developed space and larger lab, MAR Systems chose to move to Solon due to its convenient location and the very business-friendly environment.

“As someone who came to Solon as a resident after traveling with BP for many years, I have come to value the strong relationship between this city and its business community,” said Tony Kuhel, chief operating officer, MAR Systems. “As MAR Systems continues to grow and innovate we look forward to meeting the challenges for a new, more effective, eco-friendly water treatment solutions right here in Northeast Ohio from our new Solon home. We have been impressed with the warm reception and cooperation from everyone. This is what leads to jobs and success in global markets.”

ABOUT MAR SYSTEMS

MAR Systems, LLC is a privately owned, Ohio-based company that was established in 2005. As a result of the increasing presence of hazardous metal contaminants found in water, MAR Systems has developed patented, proprietary processes that remove arsenic, mercury and other heavy metals from industrial water streams through its Sorbster™ media. The Sorbster™ media works an estimated 90 percent faster than other types of media, needs no supplemental chemicals and is completely recyclable. MAR Systems’ process establishes a new standard in effectiveness, cost and simplicity to ensure water treatment facilities are using an EPA-approved media with no negative consequences on the environment.
